This invention describes a novel protein (I) with the activity of wheat starch synthase. Transgenic plants, specifically wheat, that contain (I) are used for production of starch, used particularly in foods, particularly baked and pastry goods and for making packaging materials or disposable items. Starch may also be used as starting materials for clusposable items. Starch may also be used as starting materials for glucose or glucan components (e.g. for fermentation or further chemical conversion); in paper and pulp production, as adhesives, in textiles, in preparation of gypsum-based building materials, as soil stabilizer, as wetting agent etc. in fertilizer and plant-protection compositions, as binder (in pharmaceuticals, cosmetics, coal briquetting and casting sand), as floculant in soil or coal slurries, as rubber and leather canditives, and for production of synthetic polymers, e.g. polyurethane films. Transgenic plants with increased/decreased production of (I) amylose/amylopectin ratios, degree of branching, mean chain length, phosphate content, gelatinization properties, gel- or film-forming composities, or starch grain size or structure. ```
The invention relates to a novel enzyme of starch biosynthetic pathway in a cereal plant, where the enzyme is selected from starch branching enzyme (SBE) I, SBE II, starch soluble synthase (SSS) I, and debranching enzyme (DBE), with the proviso that the enzyme is not SSS I of rice, or SBE I of rice or maize. The methods and products can be used for plants such as wheat or barley. They can be used for the expression of plants such as wheat or barley. They can be used for the expression of e.g. antisense sequences of granule-bound synthase (GBSS), SBE II, low moi. wt. glutenin, grain softness protein I, bacterial isoamylase, can be used for modifying the characteristics of starch produced by a
                                                                                                                                                                                                                                                                                                                                                                           plant. The present sequence represents the wheat SSS I cDNA sequence.
                                                                                                                                                         οŧ
                                                                                                                                                   New isolated cereal plant enzyme genes used for, e.g. expression antisense sequences of granule bound synthase

This near full-length cDNA clone, designated TaSSS, codes for a soluble starch synthase (see AAW23837) of summer wheat (cv. Florida).

It was isolated from a phage cDNA library of 21-day-old wheat caryopses by screening with a per fragment derived from rice soluble starch synthase (see also AAV01529-30). A second clone (see AAV01528), coding for wheat granule-bound starch synthase (see AAW2938) is also claimed. These isolated nucleic acids can be inserted into vectors for production of transgenic plants, particularly starch-producing plants, specifically wheat. Use of the isolated nucleic acids, or claimed chants. Overexpression may result in improved crop yield, while modification of starch in planta may eliminate the leed for subsequent chemical/physical modification. Plants with altered levels of the various isoforms of starch synthase will caltered levels of the various isoforms of starch synthase will produce starch of different chain length, amylose/amylopectin ratio, granule size and shape, viscosity etc. The starch produced by such plants is useful particularly in foods or to produce packaging charsh.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid encoding starch synthase enzymes from wheat – for transgenic plants that produce modified forms of starch, useful e.g. in foods, or for production of packaging materials and disposable

```
The present sequence is the corn soluble starch synthase (SSI) composite gene. This was used in the construction of plasmid pSS31 for the generation of an antisense construct for suppression of SI expression in corn. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Producing transgenic cereal crops with altered starch structure useful for preparing foodstuff, paper, plastic or adhesives, comprises transforming crops with chimeric sense or antisense gene construct encoding starch synthase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Soluble starch synthase; starch fine structure; corn; transgenic plant; amylose; amylopectin; amylose polymerisation; non-granule bound starch synthase; non-GBSSI; altered starch; food; paper; plastic; adhesive; ss.

to amylopectin ratio, amylopectin fine structure, increased abundance of very short amylopectin chains and in the degree of polymerisation of amylose. These modifications can be created by controlling the expression of non-GBSSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     117

```
The soluble rice starch synthetic enzyme gene has, at the N-terminal, the transit peptide that is required for the transition of this enzyme to the amyloplast. Introduction of this gene into the rice protoplast augments the expression of soluble rice starch synthetic enzyme. The transit peptide coding sequence can be used for the efficient transition of any protein into amyloplasts.
                                                                                                                                                                                                                                                                                                                                                                                                  Soluble rice starch synthetic enzyme gene and transit peptide for the efficient transport of heterologous proteins to umyloplast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           174 ......AGGAGG.....AGGT 186

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             317
                                                               35
                                                                                                                                                                                                                                                  29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence encodes maize starch synthase type I, useful in the production of starch. Starch can be used in various conventional starch applications, e.g. starch hydrolysate products, foods, papermaking, adhesives, textiles, building materials, soil stabilisation, agrochemicals, pharmaceuticals, cosmetics, coal briquettes, ore and coal slurries, foundry casting, rubber, leather and synthetic polymers. The enzyme produces a starch stated to have different physicochemical properties, especially viscosity and gelling properties, from wild type starch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding maize starch synthase type I protein – for producing transgenic plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   34

The present sequence is the corn soluble starch synthase (SSI) DNA sequence comprising the entire SSI coding region and a 3' UTR fragment inserted into plasmid pSS65-C11. The chimeric gene containing the zein promoter followed by the 3'UTR is used as a sense construct for preparation of transgenic corn expressing altered starch structure. The Producing transgenic cereal crops with altered starch structure useful for preparing foodstuff, paper, plastic or adhesives, comprises transforming crops with chimeric sense or antisense gene construct encoding starch synthase Soluble starch synthase; starch fine structure; corn; transgenic plant; amylose; amylopectin; amylose polymerisation; non-granule bound starch synthase; non-GBSSI; altered starch; food; paper; plastic; adhesive; ss. Corn soluble starch synthase gene fragment inserted in pSS65-C11. 1999 TATAGTAAGCTGAATGATGAAAGAAAACCCCTGTACATTACATGGAAGGC 2048 2128 GCCGAACGATTTTGAAGGATAGGAAGGGGAGCTGGAAGCAGTCACGC 2177TGCCTCGATGGACCGGATGCAGTGAATCCA 2127 999 667 SerSerPheArgGlyProGluGlyTyrPro.....CysThrLeuArgCy 681 714 728 681 sProAlaThrValGluSerGlnCysAlaCysLeuLeuTrpPheAlaGlyS 698 seq_name: /SIDS1/gcgdata/geneseq/geneseqn/NA2000.DAT:AAZ50643 634 ArgSerSerSerGlyProSerTrpThrAsnProThrSerCysArgArgGl 650 yLeuGlyArgSerLysCys.GluSerProSerAlaLeuLysThrSerSer 698 erArgThrTyrAspGlyCysAlaAlaAlaAlaValThrAlaSerGlyGly 715 ArgGlnLeuGlnPheTrpGlyIleArgLysGlyCysAla.....Al 2178 AGGCAGCCTCGCCGTGATTCATATGGAACAAGCTGGAGTCAGT 2220 728 aGlyTrpLeuThrAlaLysHisSerAspGlySerLeuSer 742 ij ы seq_documentation_block: ID AAZ50643 standard; cDNA; 2008 BP. ```
starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin ratio, amylopectin fine structure, increased abundance of very short amylopectin chains and in the degree of polymerisation of amylose. These modifications can be created by controlling the expression of non-GBSSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   117

```

```
The sequence is that of the soluble starch synthase I gene. It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to make modified starches comprising the payload protein, selected from, e.g. hormones, growth factors, antibodies, enzymes, dyes, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating degradation by stomach acids.
      t
 protein - useful for, e.g. producing protein(s) resistant degradation by stomach acids
                                                                                                                                                                                                                                                                                                                                                                                                                             111

```
The specification describes a method for the production of non-glycogen-like polysaccharides in a host. The method comprises transforming a host, suitable for fermentation, with genes encoding starch- or glycogen-sypthesis enzymes, and fermenting the transformants. The specification also describes hosts transformed with a gene active in glycogen synthesis and at least one non-starch branching gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Non-glycogen-like polysaccharide production; fermentation; starch synthesis enzyme; glycogen synthesis; non-starch branching gene; amylopectin; amylose; plant-like starch; maize starch soluble synthase I-2; ss.

cDNA clones SSS10.52, SSS6.31 and SSS56 (AAT67285-87) code for maize soluble starch synthase (SSS). They were isolated from a maize inbred line W6A library by screening with a probe (AAT67288) based on pea SSS, rice SSS and maize GBSS. The cDNAs can be used to produce plants with an increased capacity for producing starch, or a capacity to produce starch with an altered fine structure. They can also be used to isolate the corresponding genomic sequences from crop plants, to determine the contribution of the SSS gene to the net regulation of starch blosynthesis, and to modify the levels of starch produced by the plant. Transgenic plants (esp. maize) can be used to produce hybid plants which have higher rates of starch synthesis at temperatures above the normal optimum.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Soluble starch synthase; SSS10.52; transgenic plant; cereal; maize;

```

has been isolated and comprises a nucleotide sequence encoding a polypeptide having soluble starch synthase (SSS) activity, where the polypeptide is encoded by a maize gene. The isolated nucleic acid molecule can be used to produce transgenic plants with altered starch production. The transgenic plants produced using the nucleic acid molecule have an enhanced ability to produce structurally-altered starch. present sequence represents an isolated nucleic acid molecule which maize gene 663 ceccerceceacceecececce......cecaGCCTCCAGC 700 starch synthase activity, where polypeptide is encoded by 7.1 rGlyGlyLeuGlyAspValCysGlySerLeuProlleAlaLeuAlaAlaA 55 AlaArgProAlaGlnGlnGlnGlnLeuAlaProProLeuValProGlyPh roProLeuProAspAlaGlyValGlyGluLeuAlaProAspLeuLeuLeu GAAGGGATTGCTGAAGGTTCCATCGATAACACAGTAGTTGTGGCAAGTGA uGlnAspSerGluIleMetAspAlaAsnGluGlnProGlnAlaLysValT hrArgSerIleValPheValThrGlyGluAlaAlaPro.TyrAlaLysSe AspLysAsnTyrAlaLysAlaLeuTyrThrAlaLysHisIleLysIlePr aThralaala...ArgAlaSerAlaCysValValArgAlaArgLeuArgA eLeuAlaProProProAlaProAlaGlnSerProAlaProThrGlnP 801 CÇTCGCG...CGCCGGCCGAGGCCACGGTGAGCCGGCATCGACGCCGC rgLeuAlaArgGlyArgTyrValAlaGluLeuSerArgGluGlyProAla GluGlylleAlaGluAspSerIleAspSerIleIleValAlaAlaSerGl 6 ValGlyAlaGlyCysLeuAlaProSerValArgLeuArgAlaAspProAl Sequence 2990 BP; 758 A; 655 C; 801 G; 776 T; 0 other; Identity: 79.471 Length: Gaps: : ! ```
The sequence is that of the starch synthase coiding region from PEXS2. It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to make modified starches comprising the payload protein, selected from, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating degradation by stomach acids.

The present sequence is the corn soluble starch synthase (SSI) DNA sequence Inserted into plasmid pSS42. Chimeric gene of pSS42 was cloned into the vector pKSI7 for the generation of an antisense construct for suppression of SSI expression in corn. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin ratio, amylopectin fine structure, increased abundance of very short amylopectin chains and in the degree of polymerisation of amylose. These modifications can be created by controlling the expression of non-GBSSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Producing transgenic cereal crops with altered starch structure useful for preparing foodstuff, paper, plastic or adhesives, comprises transforming crops with chimeric sense or antisense gene construct

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exon
                                                                                                                     exon
                                                                                                                                                                                                                     exon
                                                                                                                                                                                                                                                                                                                     exon
                                                                                                                                                                                                                                                                                                                                                                                                                       exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exon
                                   Key
```

```
The invention relates to a novel enzyme of starch blosynthetic pathway in a cereal plant, where the enzyme is selected from starch branching enzyme (SBE) I, starch soluble synthase (SSS) I, and debranching enzyme (DBE), with the proviso that the enzyme is not SSI of rice, or SEE I of rice or maize. The methods and products can be used for targeting expression specifically to the endosperm of the seeds of cereal plants such as wheat or barley. They can be used for the expression of e.g. antisense sequences of granule-bound synthase (GBSS), SBE II, low mol. wt. glutenin, grain softness protein I, bacterial isommylase, and wheat high mol. wt. glutenin Bx17. They can be used for modifying the characteristics of starch produced by a plant. The present sequence represents the wheat SSS I gene sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated cereal plant enzyme genes used for, e.g. expression of antisense sequences of granule bound synthase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 10336 BP; 2733 A; 2055 C; 2625 G; 2921 T; 2 other;

```
The present sequence is the corn soluble starch synthase (SSI) DNA sequence comprising the SSI coding region of amino acids 1-494 inserted into plasmid ps564-C5. The chimeric gene containing the zein promoter followed by the SSI gene fragment is used as a sense construct for preparation of transgenic corn expressing altered starch structure. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin ratio, amylopectin fine structure, increased abundance of very short amylopectin chains and in the degree of polymerisation of expression of non-GBSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     189
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 139
